

找零錢(佔分 20 分)

問題描述：

試撰寫一個程式可以幫助你在購物商店，根據購買商品價值及實際交付金額，計算應找回最少的鈔票數和錢幣數目，最後印出對應的圖案。若購買商品價值大於實際交付金額，則須輸出”Fail”。假設幣值有紙鈔 1,000(輸出圖案\$)、500(輸出圖案#)和 100(輸出圖案%)以及硬幣 50(輸出圖案+)、10(輸出圖案!)、5(輸出圖案^)和 1(輸出圖案*)元。若商品價值為 1,376 元、而交付的金額 2,000 元，商店應找回共 624 元，包含紙鈔 1 張 500 元、1 張 100 元和硬幣 2 枚 10 元、4 枚 1 元，最後列印依據面額大至面額小的幣值順序，根據其數量列印其對應的圖案；若無對應的面額，則無須列印。

輸入說明：

輸入商品價值 m 和實際交付金額 n ，其中 $1 \leq \{m, n\} \leq 99999$ 。

輸出說明：

若 $m > n$ ，印出”Fail”，否則將找回的金額，依據面額大至面額小的幣值順序，依其數量列印其對應的圖案。

範例 1：

輸入：

700 100

輸出：

Fail

範例 2：

輸入：

4469 10000

輸出：

\$\$\$\$\$#!**

範例 3：

輸入：

7423 35122

輸出：

\$%+!!!!^*****

Making Change (20 Points)

Problem Description:

Write a program that can help you in a retail store to calculate the minimum number of bills and coins to be returned as change, based on the value of the purchased goods and the actual amount paid, and finally print the corresponding symbols.

If the value of the purchased goods is greater than the actual amount paid, it must output "Fail". Assume the currency values include bills of 1,000 (output symbol \$), 500 (output symbol #), and 100 (output symbol %), as well as coins of 50 (output symbol +), 10 (output symbol !), 5 (output symbol ^), and 1 (output symbol *). If the goods value is 1,376 and the paid amount is 2,000, the store should return a total of 624, including one 500 bill, one 100 bill, two 10 coins, and four 1 coins.

Finally, print the corresponding symbols according to their quantities in descending order of denomination; if there is no corresponding denomination, no printing is required.

Input Description:

Input the goods value m and the actual paid amount n , where $1 \leq \{m,n\} \leq 99999$.

Output Description:

If $m > n$, print "Fail", otherwise print the corresponding symbols for the returned amount based on their quantities, in descending order of denomination.

Example 1:

Input:
700 100
Output:
Fail

Example 2:

Input:
4469 10000
Output:
\$\$\$\$\$#!!!*

Example 3:

Input:
7423 35122
Output:
\$%+!!!!^****
