

最小公倍數(LCM)(佔分 20 分)

問題描述：

試撰寫一個程式去讀取 k 筆正整數 $\{m_1, m_2, m_3, \dots, m_k\}$ 後，然後計算其最小公倍數。所謂公倍數指的是可以同時被這些正整數 m 整除，而在這些公倍數中最小的稱為最小公倍數。

輸入說明：

讀取 k 筆正整數 $\{m_1, m_2, m_3, \dots, m_k\}$ ，其中 $1 \leq \{m_1, m_2, m_3, \dots, m_k\} \leq 1000$ ， $2 \leq k \leq 5$ 。每個正整數皆以空白為區隔，最後以 -1 做結尾。

輸出說明：

計算 $\text{lcm}(m_1, m_2, m_3, \dots, m_k)$ 。

範例 1：

輸入：

12 25 -1

輸出：

300

範例 2：

輸入：

128 456 215 754 -1

輸出：

591377280

Least Common Multiple (LCM) (20 points)

Problem Description:

Please write a program to read k positive integers $\{m_1, m_2, m_3, \dots, m_k\}$ and then calculate their least common multiple. A common multiple refers to a number that is divisible by all of these positive integers, and the smallest among these common multiples is called the least common multiple.

Input Specification:

Read k positive integers $\{m_1, m_2, m_3, \dots, m_k\}$, where $1 \leq \{m_1, m_2, m_3, \dots, m_k\} \leq 1000$, and $2 \leq k \leq 5$. Each positive integer is separated by a space, and the input ends with -1.

Output Specification:

Calculate $\text{lcm}(m_1, m_2, m_3, \dots, m_k)$.

Example 1:

Input:

12 25 -1

Output:

300

Example 2:

Input:

128 456 215 754 -1

Output:

591377280
