

判斷質數(佔分 20 分)

問題描述：

輸入 k 筆整數，其中 $1 \leq k \leq 10$ ，最後會以 -1 為輸入結束。試撰寫程式去判斷該整數是否為質數；若是質數印出該整數，若不是質數則印出 Not a prime number。

輸入說明：

每 1 行讀取整數 m 並判斷是否為質數，直到讀取 -1 代表輸入資料結束。其中 $10000000000 \leq m < 1000000000000000$ 。

輸出說明：

若整數 m 為質數，則印出該數；若不是質數，則印出 "Not a prime number"。

範例 1：

輸入：

9068860637300

28209837109

-1

輸出：

Not a prime number

28209837109

範例 2：

輸入：

74114833253

2700045986353

143014219478

411433095710

-1

輸出：

74114833253

2700045986353

Not a prime number

Not a prime number

Prime Number Determination (20 points)

Problem Description:

Input k integers, where $1 \leq k \leq 10$, ending with -1 as the termination signal. Write a program to determine whether each integer is a prime number. If it is a prime number, print the integer; if it is not, print "Not a prime number."

Input Description:

Each line reads an integer m to determine if it is prime, until -1 is read, signifying the end of the input data. The range of the integers is $1000000000 \leq m < 1000000000000000$.

Output Description:

If the integer m is a prime number, print the number. If it is not a prime number, print "Not a prime number".

Example 1:

Input:

9068860637300
28209837109
-1

Output:

Not a prime number
28209837109

Example 2:

Input:

74114833253
2700045986353
143014219478
411433095710
-1

Output:

74114833253
2700045986353
Not a prime number
Not a prime number
